Webinar Systems & Automation

Technical delivery for a live webinar campaign: platform setup, landing and replay pages, and email automation. Client, brand, and event names are omitted.

Tasks I performed

This note covers only the tasks I performed. Campaign copy, social posts, video, and ads were done by other team members and are not part of this case.

- Full WebinarJam setup for registration, the live session, and attendance capture.
- Brevo email setup and the automation workflows around the live date.
- A registration landing page, added as a separate page on the existing WordPress site.
- A post-webinar replay page for people who registered or missed the live session.
- CRM workflow: form submit, registered tag, reminders, attended / no-show split, then replay follow-up.

System

- WebinarJam - live session, registration, attendance.
- Brevo - confirmation, pre-session reminders, post-session replay mail.
- WordPress - landing page and replay page on the existing site, not a new website.

Workflow

1. Visitor submits the registration form on the WordPress landing page.
2. Contact is tagged as registered. Confirmation email goes out immediately.
3. Pre-session reminders run automatically in the days before the live date.
4. Attendance data splits contacts into attended and no-show.
5. Each path receives the matching follow-up, including replay access.

Not part of my task

This note does not name the client, brand, speakers, or event. It does not include screenshots of their site, campaign copy, social posts, video titles, or commercial offer language. Those assets belong to the hiring partner and the rest of the team.
